

ABSTRACT OF THE DISCLOSURE

An image signal transmitting apparatus is provided. The image signal transmitting apparatus includes: a function selection panel with a multiple keypad; a receiving unit which receives image signals via a transmission interface; a controller which controls the transmission of the image signals; and a transmitting unit, linked to the controller, for transmitting the image signals. A user first inputs the image signals which is taken by an image acquiring system or stored in a storage system to the image signal transmitting apparatus. Then, the image signal transmitting apparatus is connected to a communication link and transmits the image signals via such a communication link as a network or a wireless communication system. Then, an image signal receiving center receives the image signals for central processing, and makes pictures according to the image signals. It has the advantages of being simple, convenient, and economic.
